# 1. Overview

**CipherCraft Dashboard** is a web-based application designed to perform encryption and decryption using various classical cryptographic algorithms. Built with a user-friendly interface and robust backend, it serves as an educational tool for learning about cryptography and a practical utility for applying ciphers. The project supports six ciphers: Caesar, Monoalphabetic, Playfair, Transposition, Vigenère, and Rail Fence.

The screenshot displays the CipherCraft Dashboard web application. At the top, there is a navigation bar with a hamburger menu icon, a document icon, and a moon icon. Below this is the CipherCraft logo, which features a shield with a keyhole and a key, surrounded by various cryptographic symbols. Under the logo are three buttons: "Tool", "Tutorial", and "Guide". The main content area is titled "Cipher Craft" and contains the following elements:

- Select Operation:** A dropdown menu with "Encrypt" selected.
- Select Algorithm:** A dropdown menu with "Caesar Cipher" selected.
- Enter Text:** A text input field with the placeholder text "Type your text here...".
- Enter Shift (for Caesar):** A text input field with the placeholder text "e.g., 3".
- ☐ **Show step-by-step explanation**
- Submit** button (orange)
- Save Result** button (blue)
- Result:** A large, empty text area for the output.

At the bottom of the dashboard, there is a footer that reads "© 2025 All rights reserved - [MALI](#)".

## Cipher Craft

Select Operation:

Encrypt

Select Algorithm:

Caesar Cipher

Enter Text:

Type your text here...

Enter Shift (for Caesar):

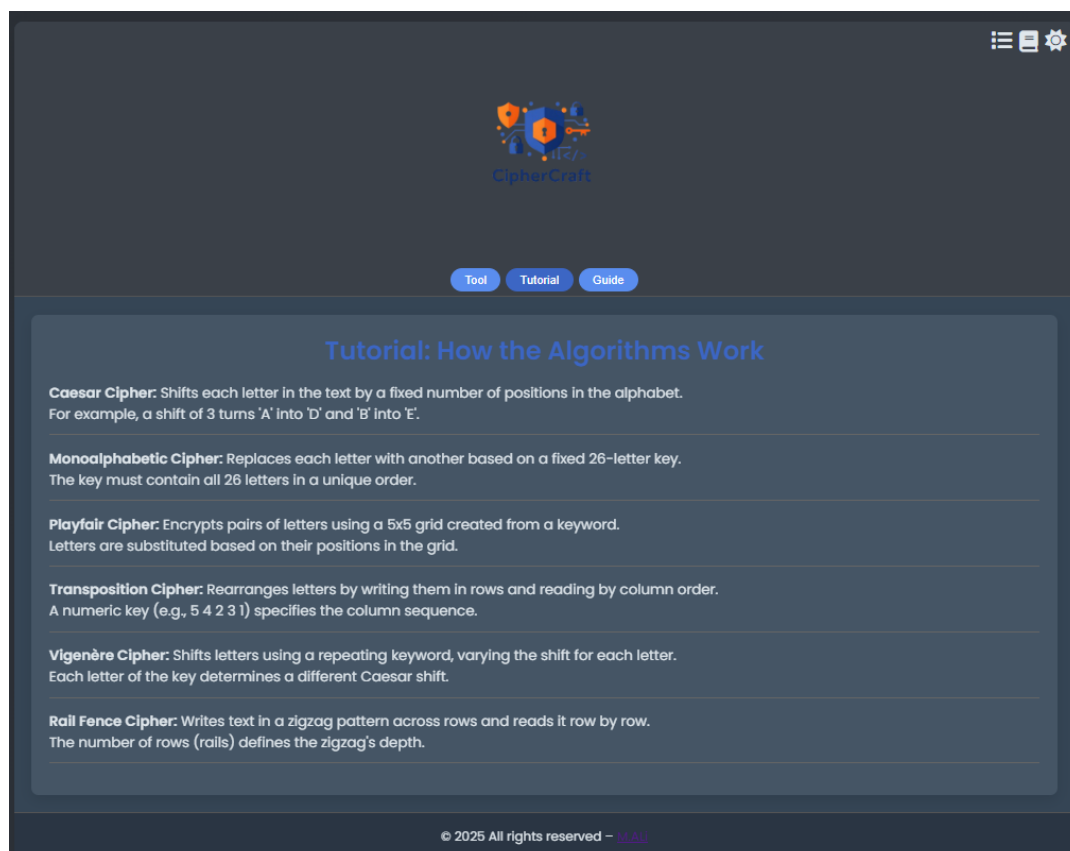

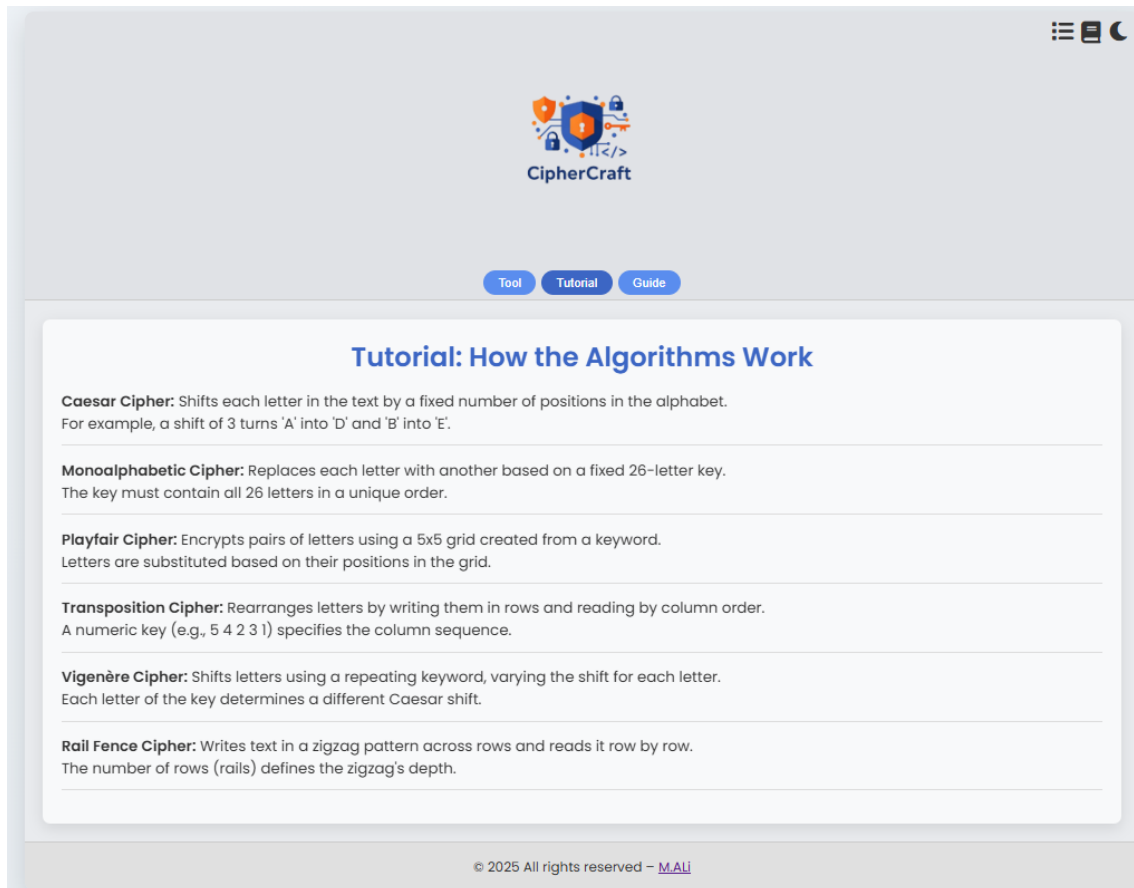

e.g., 3

☐ Show step-by-step explanation

Submit

 Save Result

Result:

[Tool](#)[Tutorial](#)[Guide](#)

## User Guide & Documentation

1. Select Encrypt or Decrypt.
2. Choose your algorithm.
3. Enter your text and the required parameter (e.g., 26 unique letters for Monoalphabetic).
4. Hit **Submit**.
5. Enable "Show step-by-step explanation" if desired.
6. Click "Save Result" to download output.

#### Examples

**Caesar Cipher**

Text: meet me after the toga party

Copy

**Monoalphabetic Cipher**

Text: if we wish to buy a car

Key: DKVQFIBJWPESCXHTMYAUOLRGNZ

Copy

**Playfair Cipher**

Text: we have to support our army

Key: Brave

Copy

**Transposition Cipher**

Text: We have to support our Army against terror Attack

Key: 5 4 2 3 1 7 6

Copy

**Vigenère Cipher**

Text: We have to support our Army against terror Attack

Key: Brave

Copy

**Rail Fence Cipher**

Text: meet me after the toga party

Copy

## 2. Features

### 2.1. Cryptographic Algorithms

1. **Caesar Cipher:** Shifts letters by a fixed number of positions.
2. **Monoalphabetic Cipher:** Substitutes letters using a 26-letter key.
3. **Playfair Cipher:** Encrypts letter pairs using a 5x5 grid.
4. **Transposition Cipher:** Rearranges letters based on a numeric key.
5. **Vigenère Cipher:** Uses a keyword for polyalphabetic substitution.
6. **Rail Fence Cipher:** Writes text in a zigzag pattern across rails.

### 2.2. User Interface

- Tabbed navigation for Tool, Tutorial, and Guide sections.
- Responsive design with light and dark modes (persistent via localStorage).
- Examples panel with pre-filled inputs for quick testing.
- Step-by-step explanation option for algorithm processes.
- Save result feature to download outputs as text files.

### 2.3. Interactivity

- Dynamic parameter input based on selected algorithm (e.g., shift for Caesar, 26-letter key for Monoalphabetic).
- Client-side validation for inputs (e.g., ensuring Monoalphabetic key has 26 unique letters).
- Hover effects (e.g., logo rotation) and animations for enhanced UX.

### 2.4. Accessibility

- Clear error messages for invalid inputs.
- Mobile-friendly layout with adjusted logo and icon sizes.

## 3. System Requirements

- **Browser:** Modern browsers (Chrome, Firefox, Safari, Edge).
- **Backend:** Python 3.8+ with required packages.
- **Internet:** Optional for external resources (e.g., Font Awesome, Google Fonts).

## 4. Usage

### 4.1. Accessing the Dashboard

- Open `http://localhost:8000` after running the application.
- The dashboard loads with the **Tool** tab active.

### 4.2. Encrypting/Decrypting Text

1. **Select Operation:** Choose **Encrypt** or **Decrypt** from the dropdown.
2. **Select Algorithm:** Pick one of the six ciphers.
3. **Enter Text:** Input the text to process in the textarea.
4. **Enter Parameter:** Provide the required key (e.g., 3 for Caesar, `DKVQFIBJWPESCXHTMYAUOLRGNZ` for Monoalphabetic).
5. **Optional:** Check **Show step-by-step explanation** for a detailed breakdown.
6. **Submit:** Click the **Submit** button to process the text.
7. **Save Result:** Click **Save Result** to download the output as `ciphercraft_result.txt`.

### 4.3. Exploring Examples.

- Select an example (e.g., Monoalphabetic Cipher with text `if we wish to buy a car`).
- Click **Copy** to auto-fill the form with the example's text and key.

### 4.4. Switching Tabs

- **Tool:** Main interface for encryption/decryption.
- **Tutorial:** Explains how each algorithm works.
- **Guide:** Provides step-by-step usage instructions and external resources.

## 4.5. Toggling Dark Mode

- Click the **Dark Mode** icon (moon/sun) in the top-right header.
- The mode persists across sessions via localStorage.

# 5. Technical Details

## 5.1. Frontend

- **HTML:** `index.html` defines the structure with tabs, forms, and an examples panel.
- **CSS:** `style.css` uses Poppins font, responsive design, and animations (e.g., logo rotation, fade-in effects).
- **JavaScript:** `script.js` handles:
  - Dynamic parameter fields based on algorithm.
  - Client-side validation (e.g., Monoalphabetic key must be 26 unique letters).
  - Tab navigation, form submission via Fetch API, and result saving.
  - Examples panel toggle and copy functionality.

## 5.2. Backend

- **Framework:** FastAPI (`main.py`) for serving the app and processing requests.
- **Endpoints:**
  - GET `/`: Serves `index.html`.
  - GET `/documentation`: Placeholder for documentation page.
  - POST `/process`: Handles encryption/decryption with parameters (`operation`, `algorithm`, `text`, `param`).
- **Ciphers:** Implemented in Python with input validation and error handling.
  - Example: Monoalphabetic Cipher maps each letter using a 26-letter key and preserves case in output.

## 5.3. Dependencies

- **External:**
  - Font Awesome 6.0.0 for icons.
  - Google Fonts (Poppins) for typography.

- **Python:**
  - fastapi: Web framework.
  - uvicorn: ASGI server.
  - jinja2: Template rendering.

## 6. Example Usage

**Scenario:** Encrypt text using the Monoalphabetic Cipher.

### 1. Inputs:

- Operation: Encrypt
- Algorithm: Monoalphabetic Cipher
- Text: if we wish to buy a car
- Key: DKVQFIBJWPESCXHTMYAUOLRGNZ

### 2. Steps:

- Select **Encrypt** and **Monoalphabetic Cipher**.
- Enter the text and key.
- Click **Submit**.

### 3. Output: WIGFGWJOHKLZDVDA

### 4. Optional: Enable **Show step-by-step explanation** to see the process or click **Save Result** to download the output.
